CORRECTION: During the preparation of this Notebook I made a change in the Tuning Tables on p.25 which I think will make them better suited to future use. In particular, I installed the 14-point average difference between SLs and LSs reported in Sec. 11.5 (p.23). In the table I used to tune the affixes, I used values projected from the SS table for both SLs and LSs, i.e., the expected value of such a word if it were to become an SS. This dynamic view of the matter, however, is faulty. It is the static value of these half-reduced words that counts. However, this is a minor issue quantitatively, and would scarcely have made any difference in the tuning of the D-Set. What it does make a difference in, however, is the average value of the C-words, which include large numbers of both kinds of half-reduced words but even more SLs than LSs. So the average score of the C-Set words is now slightly higher than reported. JCB
